

# John F. Vincent, P.E., S.E.

## PRINCIPAL STRUCTURAL ENGINEER

John Vincent is a principal structural engineer at CTLGroup. He is in charge of complex projects involving analysis of strength and serviceability deficiencies in a variety of structures, and the design of innovative repairs to enhance structural performance and long-term durability. Mr. Vincent has been involved in the analysis and repair of reinforced concrete (both conventional and prestressed reinforcement), structural steel, masonry and wood structures and components. These structures include buildings, bridges, and specialized structures within industrial plants, manufacturing facilities, and power plants. In addition to his expertise in resolving complex structural problems, Mr. Vincent has managed large, multi-disciplinary structural rehabilitation projects. On these projects, he led teams of structural, mechanical, and electrical engineers and architects.

### Academic Credentials

M.S. in Civil Engineering  
University of Illinois at Chicago,  
1986

B.S. in Civil Engineering  
Iowa State University, 1981

### Licensure/Certification

Structural Engineer  
AZ, IL

Professional Structural Engineer  
AK, IA, LA

Professional Engineer  
IL, IN, MI, PA, WA

Certified Structural Engineer

Structural Engineering  
Certification Board

### Professional Affiliations

American Concrete Institute (ACI)

American Institute of Steel  
Construction (AISC)

American Society Of Civil  
Engineers (ASCE)

Structural Engineers Association  
of Illinois

### Contact Information

5400 Old Orchard Rd.  
Skokie, IL 60077

(847) 972-3242

### Representative Project Experience

#### Structural Performance Evaluation

- Performed structural evaluation, load testing and structural monitoring of the 300,000-square-foot composite structural steel and concrete floor system of an air cargo facility at a major Midwest airport. Based on findings of the investigation, repairs were designed to upgrade strength of beam-girder connections and enhance the performance and durability of the floor system.
- Performed structural evaluation of distress in the brick masonry supports of a reinforced concrete, hyperbolic paraboloid roof structure of a church located in the Midwest. Finite element modeling was used to evaluate the behavior of the roof and supporting piers when subjected to thermal, shrinkage and creep strains. Based on findings of the evaluation, repairs were designed and constructed to restore integrity and enhance structural performance of the building.
- Performed a causation analysis of early-age floor deflections and spandrel beam cracking in the exposed reinforced concrete frame of a high-rise building. Analysis work involved field surveys, structural analysis of the floor system during construction utilizing submitted shoring/reshoring schemes, and laboratory testing of samples extracted from the structure.
- Investigated foundation settlement and related distress in a century-old building at a major university. The settlement occurred as part of the construction of deep foundations for a bridge adjacent to the building. Designed an underpinning system to stabilize the building and remedial repairs to correct damaged masonry bearing walls and wood floor system components. Oversaw construction of the repairs.
- Investigated the causes of uncontrolled settlements of a newly constructed foundation for a large printing press. Investigation included field as-built surveys, an evaluation of supporting soil, and structural analyses. Gross deficiencies in construction were identified making the existing foundation impractical to repair. A new foundation was designed and constructed through a design-build approach.

#### Deterioration Evaluation

- Investigated the causes and extent of deterioration in a reinforced concrete, waffle slab floor system of a parking structure at a major Midwestern university. The project also included evaluation of significant deficiencies in the site drainage for the parking structure and adjoining building. Extensive deterioration was identified which made isolated repairs impractical from durability and economic standpoints. Repairs were designed that involved complete removal and replacement of the elevated level of the parking structure while concurrently maintaining the integrity of the plaza level above the parking deck. The project also involved upgraded lighting systems, upgraded mechanical systems, extensive site drainage revisions,

- and ADA upgrades.
- Investigated the causes and extent of deterioration in the structural steel supports for a traveling screen system at a potable water treatment plant located in the Midwest. Findings of the investigation were utilized to develop rehabilitation recommendations.
- Evaluated several precast, prestressed concrete parking structures in the Midwest and Middle Atlantic. These structures were deteriorating and distressed as a result of improper details to accommodate thermal movements and seismic forces, as well as exposure to deicing salts. Repairs were designed to enhance service life.
- Evaluated the precast concrete exterior wall panels for four mid-rise dormitory buildings at a major Midwestern university. Corrosion in the steel connections between the panels and building frame were identified. Corrosion was attributed to improper detailing. Retrofit connections were designed.
- Investigated extensive deterioration in an 1100 vehicle, post-tensioned concrete parking structure located in the Midwest. The post-tensioning system was found to have been damaged by previous attempted repairs. Extensive deicing salt-related corrosion of the post-tensioning system and conventional reinforcement was also discovered. Repairs were designed that involved replacing damaged post-tensioning components and installation of a composite, bonded overlay to the elevated slabs. Repair work has more than doubled the service life of the structure.
- Investigated concrete deterioration in precast concrete roof deck channel slabs at several manufacturing facilities and potable water treatment plants. Developed a supplemental support system for structurally deficient members. Designed enhanced durability replacement channel slabs.

#### **Structural Strengthening**

- Investigated causes of the partial construction collapse of a reinforced shotcrete storage dome being constructed in the Great Plains. Based on findings of this work, repairs were designed to strengthen the structure.
- Designed a wind load retrofit to a large, public high school building located in the Midwest. Repair work included construction of steel truss diaphragm members around the periphery of the structure to brace existing masonry exterior walls.
- A change of use was planned for the concrete floor system of a 1950's church building that included additional dead and live loading. The floor system was analyzed and found to be inadequate for the proposed loads. A strengthening system was designed to accommodate the new loading.

#### **Power Industry**

- Developed a procedure and special process to expose the containment vessel plate for assessment of corrosion at the Davis Besse Nuclear Plant. Procedure and process development required the construction of full-size specimens of the containment including the concrete and underlying containment vessel plate. Specimens were used to investigate methods of concrete removal that would expose the containment vessel plate without damage to the plate. The process was successfully utilized on-site.
- Evaluated causation of early age cracking in a reinforced concrete protected service water building at the Oconee Nuclear Plant. The project involved site assessment of conditions, investigation of concrete components, thermal analyses, and structural analyses.
- Provided a condition survey of deteriorating reinforced concrete in the shells of the cooling towers of the Montour Steam Electric Plant in Washingtonville, PA. Field quality assurance services were provided during construction of repairs.
- Performed an evaluation of distressed precast concrete cooling system support members within the cooling towers at Plant Bowen in Cartersville, GA. Based on findings of the evaluation, repair recommendations were formulated.
